

March 23, 2022

Dear ,

As I know SIT reputation, I would like to collaborate with the institute. In my vision, it includes the ability for me to affect research and development process of new interesting research topics. It's very important for me to organize ML project development in a production-like style with software development processes like automatic testing code and maybe other CI/CD components. Based on my experience, I am convinced that not all best software development practices fit well for research projects but ignoring main approaches leads to a link to empty or not reusable GitHub repositories in academic papers.

My research interests and experience include NLP and other more exotic sequence processing problems (voice, signal, etc.), but I am ready and will be happy to participate in CV projects too. Digital avatar sound really very interesting for me.

Sincerely,

Mikhail Salnikov
